# Privacy: a challenge in modern data curation

Modern data curators seek to meet two goals at once:

1. To **disclose** key statistics/use cases of the database, in accordance with its legal, policy, and/or ethical mandates.
2. To protect the **privacy** of individuals with trust-worthy guarantees.

TITLE 13—CENSUS	
This title was enacted by act Aug. 31, 1954, ch. 1158, 68 Stat. 1012	
Chap.	Sec.
1. Administration .....	1
3. Collection and Publication of Statistics .....	41
5. Censuses .....	131
7. Offenses and Penalties .....	211
9. Collection and Publication of Foreign Trade Statistics <sup>1</sup> .....	301
10. Exchange of census <sup>2</sup> information <sup>2</sup> .....	401

(a) Neither the Secretary, nor any other officer or employee of the Department of Commerce or bureau or agency thereof, or local government census liaison, may, except as provided in section 8 or 16 or chapter 16 of this title or section 210 of the Departments of Commerce, Justice, and State, the Judiciary, and Related Agencies Appropriations Act, 1968 or section 2(i) of the Census of Agriculture Act of 1967—

(1) use the information furnished under the provisions of this title for any purpose other than the statistical purposes for which it is supplied; or

(2) make any publication whereby the data furnished by any particular establishment or individual under this title can be identified; or

(3) permit anyone other than the sworn officers and employees of the Department or bureau or agency thereof to examine the individual reports.

**For example**, the U.S. Census Bureau bears the constitutional mandate to enumerate the population every 10 years for apportionment. It is also bound by Title 13 of U.S. Code to protect respondent confidentiality.

# The U.S. Census Bureau adopts differential privacy

The screenshot displays the Harvard Data Science Review (HDSR) website, featuring a special issue titled "Differential Privacy for the 2020 Census: Can We Make Data Both Private and Useful?". The website layout includes a top navigation bar with links for HOME, ISSUES, SECTIONS, COLUMNISTS, COLLECTIONS, MEDIA FEATURES, SUBMIT, ABOUT, and MASTHEAD. A search bar, dashboard, and login/signup options are also present. The main content area is organized into several sections:

- Coming to Our Census: How Social Statistics Underpin Our Democracy (and Republic)** by Tereza A. Sullivan, Published: Jan 21, 2020. Includes a "CONNECTIONS" section with a comment by Margo J. Anderson.
- Disclosure Protection in the Context of Statistical Agency Operations: Data Quality and Related Constraints** by John L. Eltinge, Published: Jun 24, 2022. Accompanied by a green question mark icon.
- What Will It Take to Get to Acceptable Privacy-Accuracy Combinations?** by Chloé Heller, Published: Jun 24, 2022. Includes a reflection by Brummett et al. and Asquith et al.
- Transparent Privacy is Principled Privacy** by Rusbin Garg, Published: Jun 24, 2022. Accompanied by a blue magnifying glass icon.
- Implementing Differential Privacy: Seven Lessons From the 2020 United States Census** by Michael B. Vose, Published: Apr 30, 2020. Accompanied by a puzzle piece icon.
- FROM THE EDITORS** section featuring a map of the United States made of people icons.
- BROADER PERSPECTIVES** section including:
  - Differential Perspectives: Epistemic Disconnects Surrounding the U.S. Census Bureau's Use of Differential Privacy** by Rusbin Garg, Published: Jun 24, 2022.
  - Differential Privacy and Social Science: An Urgent Puzzle** by Daniel L. Liben and Foula Krieger, Published: Jan 21, 2020.
- EMPIRICAL EVALUATIONS** section including:
  - Assessing the Impact of Differential Privacy on Measures of Population and Racial Residential Segregation** by Brian Asquith, Brad Hersholt, Tracy Rogers, Shane Reed, Steven Rogstad, Jonathan Schneider, Steve Hoxby, and David Van Riper, Published: Jun 24, 2022. Accompanied by a scatter plot.
  - The Effect of Differentially Private Noise Injection on Sampling Efficiency and Funding Allocations: Evidence From the 1940 Census** by Quentin Brummett, Edward Mullay, and Kirk Walker, Published: Jun 24, 2022. Accompanied by a scatter plot.
- HARNE: Differ** by Rusbin Garg, Published: Special Issue.
- A Chronicle of the Application of Differential Privacy to the 2020 Census** by V. Joseph Holt and Joseph Salas, Published: Jun 24, 2022. Accompanied by a blue padlock icon.
- Disclosure Avoidance and the 2020 Census: What Do Researchers Need to Know?** by Erica L. Groshen and David Doroff, Published: Jun 24, 2022. Accompanied by a map of the United States.

**AND TECHNICAL CHANGES** section including:

- The 2020 Census Disclosure Avoidance System TopDown Algorithm** by John Abowd, Robert Ashmead, Ryan Cummings-Miron, Simon Garfield, Miriam Hersholt, Christine Heiss, Robert Johns, Daniel Kifer, and 6 more, Published: Jun 24, 2022.

The bottom of the page features a large image of a US Census Bureau seal and the text "United States Census Bureau".

# The mechanism of differential privacy

A random function  $s_{dp}(\mathbf{x}, \mathbf{r})$  is said to be  $\epsilon$ -differentially private<sup>2</sup> if for all *neighboring* databases  $(\mathbf{x}, \mathbf{x}')$  and all possible state  $a$ ,

$$\frac{\Pr(s_{dp}(\mathbf{x}, \mathbf{r}) = a \mid \mathbf{x})}{\Pr(s_{dp}(\mathbf{x}', \mathbf{r}) = a \mid \mathbf{x}')} \leq \exp(\epsilon).$$

<https://www.ons.gov.uk/peoplepopulationandcommunity>

That is, differentially private mechanisms conceal the **confidential data  $x$**  by infusing **crafted noise  $r$**  into the data product  $s_{dp}$  for release:

$$\mathbf{x} \longrightarrow s_{dp}(\mathbf{x}, \mathbf{r})$$

---

<sup>2</sup>Dwork et al. (2006). Calibrating noise to sensitivity in private data analysis. *TCC* (pp 265-284)

# Differential privacy: benefits and challenges

- ✓ **Provability:** differential privacy guarantees are formal and verifiable;
- ✓ **Transparency:** The probabilistic specification of the privacy mechanism can be publicized without sabotaging the privacy guarantee.
- ▶ **Statistical implication:** transparency is *necessary* for drawing principled inference from privatized data.<sup>3</sup>

How do we leverage the privacy mechanism for statistical inference?

---

# Situating our ( statistical $\times$ privacy ) framework

**$x$  is the truth**

$$s_{\text{dp}} \mid x \sim \eta(s_{\text{dp}} \mid x)$$

- ▶ Infer  $x$  based on  $s_{\text{dp}}$ ;
- ▶  $\eta$  is the only source of uncertainty.

**$x$  is a sample**

$$x \mid \theta \sim f(x \mid \theta)$$

$$s_{\text{dp}} \mid x \sim \eta(s_{\text{dp}} \mid x)$$

- ▶ Infer  $\theta$  based on  $s_{\text{dp}}$ .
- ▶ Uncertainty stems from  $\eta, f$ , and beyond

**design framework**

Choose the best mechanism ( $\eta$ ) + estimator combo:<sup>4</sup>

$$\hat{\theta}_{\text{design}}(s_{\text{dp}}^*(x))$$

**adjustment framework**

For a given mechanism ( $\eta$ ), perform the best inference:

$$\hat{\theta}_{\text{adjust}}(s_{\text{dp}}(x))$$

# Statistical inference from privatized data

Without privacy:

- ▶ Likelihood inference:  $\ell(\theta \mid x) = f(x \mid \theta)$ ;
- ▶ Bayesian inference:  $p(\theta \mid x) \propto p(\theta)f(x \mid \theta)$ .

With privacy:

- ▶ The **marginal likelihood** integrates over  $\mathcal{X}$ , the entire space of confidential databases:

$$\ell(\theta \mid s_{\text{dp}}) = \int_{\mathcal{X}} \eta(s_{\text{dp}} \mid x) f(x \mid \theta) dx.$$

- ▶ The (exact) Bayesian **posterior** distribution is

$$p(\theta \mid s_{\text{dp}}) \propto p(\theta) \ell(\theta \mid s_{\text{dp}}).$$

# Statistical inference from privatized data

Without privacy:

- ▶ Likelihood inference:  $\ell(\theta \mid x) = f(x \mid \theta)$ ;
- ▶ Bayesian inference:  $p(\theta \mid x) \propto p(\theta)f(x \mid \theta)$ .

With privacy:

- ▶ The **marginal likelihood** integrates over  $\mathcal{X}$ , the entire space of confidential databases:

$$\ell(\theta \mid s_{\text{dp}}) = \int_{\mathcal{X}} \eta(s_{\text{dp}} \mid x) f(x \mid \theta) dx.$$

- ▶ The (exact) Bayesian **posterior** distribution is

$$p(\theta \mid s_{\text{dp}}) \propto p(\theta)\ell(\theta \mid s_{\text{dp}}).$$

# Statistical inference from privatized data

Without privacy:

- ▶ Likelihood inference:  $\ell(\theta \mid \mathbf{x}) = f(\mathbf{x} \mid \theta)$ ;
- ▶ Bayesian inference:  $p(\theta \mid \mathbf{x}) \propto p(\theta)f(\mathbf{x} \mid \theta)$ .

With privacy:

- ▶ The **marginal likelihood** integrates over  $\mathcal{X}$ , the entire space of confidential databases:

$$\ell(\theta \mid s_{\text{dp}}) = \int_{\mathcal{X}} \eta(s_{\text{dp}} \mid \mathbf{x}) f(\mathbf{x} \mid \theta) d\mathbf{x}.$$

- ▶ The (exact) Bayesian **posterior** distribution is

$$p(\theta \mid s_{\text{dp}}) \propto p(\theta)\ell(\theta \mid s_{\text{dp}}).$$

# Statistical inference from privatized data

Without privacy:

$$\ell(\theta \mid s_{\text{dp}}) = \int_{\mathcal{X}} \eta(s_{\text{dp}} \mid x) f(x \mid \theta) dx.$$

- ▶ The (exact) Bayesian **posterior** distribution is

$$p(\theta \mid s_{\text{dp}}) \propto p(\theta)\ell(\theta \mid s_{\text{dp}}).$$

# Existing solutions

Approximations:

- ▶ Asymptotic approximation (Wang et al., 2018)
- ▶ Variational approximation (Karwa et al., 2016)
- ▶ Parametric bootstrap (Ferrando et al., 2020)

Exact but limited:

- ▶ Integrate exactly (Awan & Slavković, 2018, 2020)
- ▶ MCMC with latent sufficient stat (Bernstein & Sheldon, 2018, 2019)
- ▶ Exact inference with approximate computation (Gong, 2019)

## Our Goal

An **efficient** and **user-friendly** sampler for the **exact** posterior that works for **general** choices of the data model  $f$  and the prior  $p$ .

# A traditional Gibbs sampler

**Problem #1:** If  $n$  individuals each contribute  $d$  features, then

$$\mathcal{X} = \mathbb{X}^{n \times d}.$$

The likelihood may be intractable, and the posterior *doubly* intractable.

$$p(\theta \mid s_{\text{dp}}) \propto p(\theta) \int_{\mathcal{X}} \eta(s_{\text{dp}} \mid x) f(x \mid \theta) dx.$$

# A traditional Gibbs sampler

**Problem #1:** If  $n$  individuals each contribute  $d$  features, then

$$\mathcal{X} = \mathbb{X}^{n \times d}.$$

The likelihood may be intractable, and the posterior *doubly* intractable.

$$p(\theta \mid s_{\text{dp}}) \propto p(\theta) \int_{\mathcal{X}} \eta(s_{\text{dp}} \mid x) f(x \mid \theta) dx.$$

**Data Augmentation (DA).** Iterate the following:

- 1: sample  $\theta \mid x, s_{\text{dp}} \stackrel{d}{=} \theta \mid x$
- 2: **for**  $i = 1, \dots, n$  **do**
- 3:   sample  $x_i \mid x_{-i}, \theta, s_{\text{dp}}$
- 4: **end for**

jessicastringham.net

# A traditional Gibbs sampler

**Problem #1:** If  $n$  individuals each contribute  $d$  features, then

$$\mathcal{X} = \mathbb{X}^{n \times d}.$$

The likelihood may be intractable, and the posterior *doubly* intractable.

$$p(\theta \mid s_{\text{dp}}) \propto p(\theta) \int_{\mathcal{X}} \eta(s_{\text{dp}} \mid x) f(x \mid \theta) dx.$$

**Data Augmentation (DA).** Iterate the following:

- 1: sample  $\theta \mid x, s_{\text{dp}} \stackrel{d}{=} \theta \mid x$
- 2: **for**  $i = 1, \dots, n$  **do**
- 3:   sample  $x_i \mid x_{-i}, \theta, s_{\text{dp}}$
- 4: **end for**

jessicastringham.net

**Problem #2:** the conditional dist.  $x \mid \theta, s_{\text{dp}}$  is both  $f$ - and  $\eta$ -specific.

# A general Metropolis-within Gibbs sampler

**Solution.** Propose  $\mathbf{x} \mid \theta$  instead (or  $x_i \mid \theta$  under conditional independence):

---

One Iteration of the privacy-aware Metropolis-within-Gibbs sampler

---

- 1: update  $\theta \mid \mathbf{x}$
- 2: **for**  $i = 1, \dots, n$  **do**
- 3:   propose  $x_i^* \mid \theta$
- 4:   accept  $x_i^*$  with probability

$$\alpha(x_i^* \mid x_i, x_{-i}, \theta) = \min \left\{ \frac{\eta(s_{\text{dp}} \mid x_i^*, x_{-i})}{\eta(s_{\text{dp}} \mid x_i, x_{-i})}, 1 \right\}$$

- 5: **end for**
-

# A general Metropolis-within Gibbs sampler

**Solution.** Propose  $\mathbf{x} \mid \theta$  instead (or  $x_i \mid \theta$  under conditional independence):

---

One Iteration of the privacy-aware Metropolis-within-Gibbs sampler

---

- 1: update  $\theta \mid \mathbf{x}$
- 2: **for**  $i = 1, \dots, n$  **do**
- 3:   propose  $x_i^* \mid \theta$
- 4:   accept  $x_i^*$  with probability

$$\alpha(x_i^* \mid x_i, x_{-i}, \theta) = \min \left\{ \frac{\eta(s_{\text{dp}} \mid x_i^*, x_{-i})}{\eta(s_{\text{dp}} \mid x_i, x_{-i})}, 1 \right\}$$

- 5: **end for**

---

If  $\eta$  is  $\epsilon$ -DP, then for all  $\theta, x_{-i}, x_i$  and  $x_i^*$ :

$$\alpha(x_i^* \mid x_i, x_{-i}, \theta) \geq \exp(-\epsilon).$$

As  $\epsilon$  decreases (**more privacy**), acceptance rate  $\alpha$  increases (**more computational efficiency**)!

e.g. for  $\epsilon = 1$ ,  $\alpha \geq 36.7\%$ .

# Requirements, run time, and efficiency

The proposed sampler requires:

- ▶ **Assumption 1.** The analyst knows how to sample the posterior if the data aren't privatized, i.e. she has a Markov kernel targeting  $p(\theta \mid x)$ .

Furthermore, if we have

- ▶ **Assumption 2 (Record Additivity).** The privacy mechanism can be written as  $\eta(s_{\text{dp}} \mid x) = g\left(s_{\text{dp}}, \sum_{i=1}^n t_i(x_i, s_{\text{dp}})\right)$  for some known and tractable functions  $g, t_1, \dots, t_n$ , then:

The Gibbs sampler requires  $O(n)$  number of operations to update the full latent database according to  $p(x \mid \theta, s_{\text{dp}})$ .

**Note:**

- ▶ Even without privacy, one round of an MCMC procedure typically takes  $O(n)$  time;
- ▶ Many commonly used DP mechanisms satisfy record additivity. e.g. additive, exponential mechanism, objective perturbation, etc.

# Requirements, run time, and efficiency

The proposed sampler requires:

- ▶ **Assumption 1.** The analyst knows how to sample the posterior if the data aren't privatized, i.e. she has a Markov kernel targeting  $p(\theta \mid x)$ .

Furthermore, if we have

- ▶ **Assumption 2** (*Record Additivity*). The privacy mechanism can be written as  $\eta(s_{\text{dp}} \mid x) = g\left(s_{\text{dp}}, \sum_{i=1}^n t_i(x_i, s_{\text{dp}})\right)$  for some known and tractable functions  $g, t_1, \dots, t_n$ , then:

The Gibbs sampler requires  $O(n)$  number of operations to update the full latent database according to  $p(x \mid \theta, s_{\text{dp}})$ .

**Note:**

- ▶ Even without privacy, one round of an MCMC procedure typically takes  $O(n)$  time;
- ▶ Many commonly used DP mechanisms satisfy record additivity.  
e.g. additive, exponential mechanism, objective perturbation, etc.

# Ergodicity of the proposed sampler

Under the conditions

- A1 the prior distribution is proper and  $p(\theta) > 0$  for all  $\theta$  in  $\Theta = \{\theta \mid f_\theta(x) > 0 \text{ for some } x\}$ ;
  - A2 the model is such that the set  $\{x : f(x \mid \theta) > 0\}$  does not depend on  $\theta$ ; and
  - A3 the privacy mechanism satisfies  $\eta(s_{\text{dp}} \mid x) > 0$  for all  $x \in \mathbb{X}^n$ ,
- the Metropolis-within-Gibbs sampler on the joint space  $(\mathbb{X}^n \times \Theta)$  is *ergodic* and it admits  $p(x, \theta \mid s_{\text{dp}})$  as the unique limiting distribution.

Furthermore, if one can directly sample from  $p(\theta \mid x)$ , then the resulting  $(x, \theta)$  chain as well as the marginal chains are *geometrically ergodic* if there exists  $0 < a \leq b < \infty$  such that  $a \leq f(x \mid \theta) \leq b$  for all  $\theta$  and  $x$ .

# Application: a naïve Bayes classifier

- ▶  $x = (x_1, \dots, x_K)$  are *features*, each taking values in  $\{1, \dots, J_K\}$ ;
- ▶  $y \in \{1, \dots, I\}$  is the *class*;
- ▶ The non-private data consists of  $n$  i.i.d. copies of  $(x, y)$ .
- ▶ **Goal:** predict the class given the features:  $\Pr(y \mid x)$ .
- ▶ The *naïve Bayes classifier* assumes  $\Pr(x \mid y) = \prod_{k=1}^K \Pr(x_k \mid y)$ ;
- ▶ Release the noisy counts:  $s_{dp} = \{n_{ijk} + \text{Laplace}(2K/\epsilon)\}_{ijk}$ .

		$X_1$				$X_2$						$X_K$	
		1	2			1	2					1	2

		$X_1$				$X_2$						$X_K$	
		1	2			1	2					1	2
$Y$	1	$p_{11}^1$	$p_{12}^1$	$Y$	1	$p_{11}^2$	$p_{12}^2$	$\dots$	$Y$	1	$p_{11}^K$	$p_{12}^K$	
	2	$p_{21}^1$	$p_{22}^1$		2	$p_{21}^2$	$p_{22}^2$			2	$p_{21}^K$	$p_{22}^K$	

TABLE 2

TABLE 2

An example of the parameters of the Naive Bayes model for a  $2 \times 2 \times K$  table.

# Simulation setup

For the simulation, set

- ▶  $N = 100$  (number of samples);
- ▶  $I = 5$  (number of classes);
- ▶  $K = 5$  (number of features);
- ▶  $J_K = 3$  (number of options for each feature);
- ▶  $\epsilon \in \{.1, .3, 1, 3, 10\}$ ;
- ▶ Prior for all parameters:  $\text{Dirichlet}(2, \dots, 2)$ .

# Posterior mean

- ▶ Fix a confidential dataset;
- ▶ Create 100 privatized datasets at each  $\epsilon$  value;
- ▶ Run one chain for each privatized dataset for 10,000 iterations;
- ▶ For each chain, calculate the posterior mean for  $p_i = \Pr(y = i)$ .

# Frequentist coverage

**Table.** Frequentist coverage of a 90% credible interval for  $p_i = \Pr(y = i)$  at different  $\epsilon$  values. 100 replicates per  $\epsilon$  value.

$\epsilon$	$p_1 = .097$	$p_2 = .148$	$p_3 = .145$	$p_4 = .446$	$p_5 = .163$
.1	1	1	1	<b>.36</b>	1
.3	.97	1	1	<b>.59</b>	1
1	.94	.99	.97	<b>.83</b>	.98
3	.95	.91	.97	.89	.93
10	.92	.88	.94	.92	.9

# Empirical acceptance rates

- ▶ 100 chains at each  $\epsilon$  value;
- ▶ Each chain ran for 10,000 iterations;
- ▶ Minimum (orange) and mean (blue) acceptance rates for each chain.

# Summary

An MCMC framework for Bayesian inference from privatized data:

- ▶ **Exact:** targets the correct posterior distribution;
- ▶ **General:** applicable to a wide range of statistical models and privacy mechanisms;
- ▶ **User-friendly:** mechanism independent, no (further) tuning parameters.

## the privacy-efficiency alignment

Smaller  $\epsilon$  implies higher acceptance rate: allowing the “**free exploitation**” of the privacy guarantee for computational efficiency.
